

Inventory Management – Detailed Documentation

Overview

The Inventory Management application helps efficiently edit and manage inventory data in a Shopify store.

Navigation Overview

The application currently includes the following navigation sections:

- Get Products
- Import Product Inventory Data
- Export Product Inventory Data
- How To Use

1. Get Products

This section displays all products available in the Shopify store in a table format. The table includes details such as the product title, price, inventory quantity, and more.

2. Import Product Inventory Data

This feature allows users to bulk-update product inventory quantities by uploading an Excel file. Before importing, the user must select how the system should process the data using the Location Selection dropdown.

Location Selection Options

- All Locations (default):
 - Allows importing inventory data for multiple locations in a single file.
 - Each row in the Excel file may represent a different location.
 - Ideal for multi-location bulk inventory updates.
- Specific Location:
 - Processes inventory updates only for the selected location (e.g., Main Warehouse, Store A).

- Rows with locations different from the selected one will be rejected and displayed as errors.
- Recommended when updating inventory for a single physical store or warehouse.

Excel File Required Columns

- SKU – A unique product identifier used for matching products.
- Inventory Location – The name of the location to update.
- Quantity Available – The updated inventory quantity for that location (Required only if All Location option is selected otherwise it is optional).

Note: Additional columns may exist in the file, but they will be ignored. The system only considers SKU and Inventory Location for matching.

3. Export Product Inventory Data

Users can export product inventory data into an Excel file. The exported information depends on whether the user selects 'All Locations' or a specific location.

Location Selection Modes

- All Locations Mode:
 - Exports inventory data for all locations in the Shopify store.
 - Useful for auditing or reconciling multi-warehouse inventory.
- Specific Location Mode:
 - Exports product inventory only for the selected location.
 - Ideal for warehouse-specific stock checks or planning.

4. How To Use

It will allow users to download a detailed guide on how to use this app.
